

Vaginal Insufflation Kit

The idea behind this device is to increase the surface area with which the ozone will come into contact. The spiral design allows maximum contact with the vaginal wall. By allowing the ozone flow to travel down the vagina, ozone gas comes in contact with the vaginal arteries and

the internal pudendal vessels for maximum benefit and absorption.

Be sure to lubricate the probe before insertion. You can use a personal lubricant or a vegetable oil of your choice.

How to use with an insufflation bag

Connect the insufflation bag to the ozone out on your ozone generator. Make sure the clamp or one way switch on your bag is open to allow the bag to fill. Fill the bag to the amount you prefer, then close the clamp or one way switch and disconnect from the ozone generator.

Connect the bag to the silicone tube coming out of the center of the probe. Once the probe is in place, open the bag's clamp or one way switch and slowly squeeze the bag to administer ozone.

Bag sold separately.

How to use with an ozone syringe

Connect the syringe to the ozone out on your ozone generator. Fill the syringe to your chosen amount and remove the syringe.

Connect the syringe to the silicone tube coming out the center of the probe. Once the probe is in place, you can slowly push on the plunger to administer ozone.

Syringe sold separately.

How to use with direct connection to an ozone generator

Connect the silicone tube coming out the center of the probe directly to the ozone out on your ozone generator or your ozone humidifier. Once the probe is in place, you can set your oxygen source and ozone to achieve the desired strength.

Note for all uses: If you experience sensitivity or drying, consider adding an ozone humidifier to your kit. You can find several sizes at www.promolife.com/ozone-oxygen/ozone-glassware/
